It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Maclellan Site, Tissue - Berries, Cobalt (Co), mg/kg ww was not processed!

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use			
95% Student's-t UCL	37.94		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.			

UCL Statistics for Data Sets with Non-Detects			
User Selected Options			
Date/Time of Computation	ProUCL 5.112/6/2019 1:03:16 AM		
From File	Gordon Region, Tissue - Labrador tea, Cadmium (Cd), mg_kg ww.xls		
Full Precision	OFF		
Confidence Coefficient	95%		
Number of Bootstrap Operations	2000		

Gordon Region, Tissue - Labrador tea, Cadmium (Cd), mg/kg ww

General Statistics			
Total Number of Observations	27	Number of Distinct Observations	22
Number of Detects	1	Number of Non-Detects	26
Number of Distinct Detects	1	Number of Distinct Non-Detects	21

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Gordon Site, Tissue - Labrador tea, Cadmium (Cd), mg/kg ww was not processed!

For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	0.0461		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0302

Suggested UCL to Use			
95% KM (t) UCL	0.177		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	0.0205		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0111

Suggested UCL to Use			
95% Adjusted Gamma UCL	34.95		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	34.58	nu star (bias corrected)	26.48

Mean (detects)	0.129		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Mean of Logged Detects	-5.076	SD of Logged Detects	0.0679

Warning: Data set has only 2 Detected Values.

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use

guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use			
95% Student's-t UCL	0.125		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean of Logged Detects	-1.633	SD of Logged Detects	0.902

Warning: Data set has only 2 Detected Values.

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use

guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Theta hat (MLE)	0.0381	Theta star (bias corrected MLE)	0.0734
nu hat (MLE)	11.21	nu star (bias corrected)	5.815
Mean (detects)	0.0427		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.0051	Mean	0.0373
Maximum	0.1	Median	0.0248
SD	0.0374	CV	1.004
k hat (MLE)	1.081	k star (bias corrected MLE)	0.652

Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Gordon Region, Tissue - Small Mammal, Lead (Pb), mg/kg ww

General Statistics

Total Number of Observations	6	Number of Distinct Observations	2
Number of Detects	1	Number of Non-Detects	5
Number of Distinct Detects	1	Number of Distinct Non-Detects	1

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Gordon Site, Tissue - Small Mammal, Lead (Pb), mg/kg ww was not processed!

General Statistics			
Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	0.12	Mean	0.265
Maximum	0.48	Median	0.245
SD	0.144	Std. Error of Mean	0.0589
Coefficient of Variation	0.544	Skewness	0.511

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test			
Shapiro Wilk Test Statistic	0.903	**Shapiro Wilk GOF Test**

Coefficient of Variation	0.0897	Skewness	0.417

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.977	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.788	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.175	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.325	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

97.5% Chebyshev(Mean, Sd) UCL	3.558	99% Chebyshev(Mean, Sd) UCL	3.77
Suggested UCL to Use			
95% Student's-t UCL	3.317		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.			

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.112/6/2019 4:43:43 AM

MacLellan Region, Tissue - Small Mammal, Lead (Pb), mg/kg ww

General Statistics

Total Number of Observations	6	Number of Distinct Observations	5
Number of Detects	5	Number of Non-Detects	1
Number of Distinct Detects	4	Number of Distinct Non-Detects	1
Minimum Detect	0.048	Minimum Non-Detect	0.04
Maximum Detect	0.088	Maximum Non-Detect	0.04
Variance Detects	3.5050E-4	Percent Non-Detects	16.67%
Mean Detects	0.068	SD Detects	0.0187
Median Detects	0.077	CV Detects	0.275
Skewness Detects	-0.377	Kurtosis Detects	-2.9
Mean of Logged Detects	-2.721	SD of Logged Detects	0.292

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.828	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.762	Detected Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.285	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.343	Detected Data appear Normal at 5% Significance Level

Detected Data appear Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

KM Mean	0.0633	KM Standard Error of Mean	0.00845
KM SD	0.0185	95% KM (BCA) UCL	N/A

k hat (MLE)	15.36	k star (bias corrected MLE)	6.277
Theta hat (MLE)	0.00443	Theta star (bias corrected MLE)	0.0108
nu hat (MLE)	153.6	nu star (bias corrected)	62.77
Mean (detects)	0.068		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.0284	Mean	0.0614
Maximum	0.088	Median	0.0625

Total Number of Observations	6	Number of Distinct Observations	4
		Number of Missing Observations	0
Minimum	0.3	Mean	0.368
Maximum	0.52	Median	0.36
SD	0.0808	Std. Error of Mean	0.033
Coefficient of Variation	0.22	Skewness	1.615

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test			
Shapiro Wilk Test Statistic	0.812	**Shapiro Wilk GOF Test**	
5% Shapiro Wilk Critical Value	0.788	Data appear Normal at 5% Significance Level	
Lilliefors Test Statistic	0.325	**Lilliefors GOF Test**	
5% Lilliefors Critical Value	0.325	Data Not Normal at 5% Significance Level

Suggested UCL to Use			
95% Student's-t UCL	0.435		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics			
Total Number of Observations	63	Number of Distinct Observations	3
Number of Detects	1	Number of Non-Detects	62
Number of Distinct Detects	1	Number of Distinct Non-Detects	2

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Gordon Site, Fish - Muscle, Antimony (Sb), mg/kg ww was not processed!

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Mean (detects)	0.00677		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)			
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.			
For additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)			
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.			
For additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use			
95% Adjusted Gamma UCL	0.231		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Mean (detects)	0.0217		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0179

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use			
95% H-UCL	0.162		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

97.5% Chebyshev(Mean, Sd) UCL	1.49	99% Chebyshev(Mean, Sd) UCL	1.936
Suggested UCL to Use			
95% H-UCL	0.973		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)			
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.			
For additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.			

UCL Statistics for Data Sets with Non-Detects

Approximate Chi Square Value (889.81, α)	821.6	Adjusted Chi Square Value (889.81, β)	818.2
95% Gamma Approximate KM-UCL (use when n>=50)	0.00512	95% Gamma Adjusted KM-UCL (use when n<50)	0.00514
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.004	Mean	0.00818
Maximum	0.01	Median	0.01
SD	0.00236	CV	0.289
k hat (MLE)	9.961	k star (bias corrected MLE)	9.075

These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)			
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.			
For additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma Statistics on Detected Data Only

k hat (MLE)	4.567	k star (bias corrected MLE)	4.045
Theta hat (MLE)	0.0107	Theta star (bias corrected MLE)	0.0121
nu hat (MLE)	228.3	nu star (bias corrected)	202.3
MLE Mean (bias corrected)	0.0488	MLE Sd (bias corrected)	0.0243

Gamma Kaplan-Meier (KM) Statistics			
k hat (KM)	3.298	nu hat (KM)	191.3
Approximate Chi Square Value (191.26, α)	160.3	Adjusted Chi Square Value (191.26, β)	158.6
95% Gamma Approximate KM-UCL (use when n>=50)	0.0535	95% Gamma Adjusted KM-UCL (use when n<50)	0.0541
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0435
Maximum	0.105	Median	0.038

Theta hat (MLE)	0.0593	Theta star (bias corrected MLE)	0.0665
nu hat (MLE)	195.1	nu star (bias corrected)	173.9
MLE Mean (bias corrected)	0.222	MLE Sd (bias corrected)	0.122

Gamma Kaplan-Meier (KM) Statistics			
k hat (KM)	2.263	nu hat (KM)	131.3
Approximate Chi Square Value (131.25, α)	105.8	Adjusted Chi Square Value (131.25, β)	104.4
95% Gamma Approximate KM-UCL (use when n>=50)	0.26	95% Gamma Adjusted KM-UCL (use when n<50)	0.264
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.201
Maximum	0.68	Median	0.16

nu hat (MLE)	102.4	nu star (bias corrected)	97.57

Mean (detects)	0.0589		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.112/5/2019 11:25:52 PM
From File	Gordon Region (All Lakes), Fish - Liver, Nickel (Ni), mg_kg ww.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Gordon Region (All Lakes), Fish - Liver, Nickel (Ni), mg/kg ww

General Statistics

Total Number of Observations	63	Number of Distinct Observations	2
Number of Detects	1	Number of Non-Detects	62
Number of Distinct Detects	1	Number of Distinct Non-Detects	1

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Gordon Site, Fish - Liver, Nickel (Ni), mg/kg ww was not processed!

Mean (detects)	0.00343		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	7.05	k star (bias corrected MLE)	6.262
Theta hat (MLE)	0.00279	Theta star (bias corrected MLE)	0.00314
nu hat (MLE)	366.6	nu star (bias corrected)	325.6

Mean (detects)	0.0197		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0151
Maximum	0.041	Median	0.011

DL/2 is not a recommended method, provided for comparisons and historical reasons			
Nonparametric Distribution Free UCL Statistics			
Detected Data appear Approximate Normal Distributed at 5% Significance Level			
Suggested UCL to Use			
95% KM (t) UCL	0.0169		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% KM (t) UCL	0.105		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

90% KM Chebyshev UCL	0.446	95% KM Chebyshev UCL	0.561
97.5% KM Chebyshev UCL	0.72	99% KM Chebyshev UCL	1.034
Gamma GOF Tests on Detected Observations Only			
A-D Test Statistic	0.155	**Anderson-Darling GOF Test**	
5% A-D Critical Value	0.711	Detected data appear Gamma Distributed at 5% Significance Level	
K-S Test Statistic	0.145	**Kolmogrov-Smirnoff GOF**	
5% K-S Critical Value	0.339	Detected data appear Gamma Distributed at 5% Significance Level	
Detected data appear Gamma Distributed at 5% Significance Level			
Gamma Statistics on Detected Data Only			
k hat (MLE)	1.305	k star (bias corrected MLE)	0.764
Theta hat (MLE)	0.592	Theta star (bias corrected MLE)	1.012
nu hat (MLE)	15.66	nu star (bias corrected)	9.164
MLE Mean (bias corrected)	0.773	MLE Sd (bias corrected)	0.885

Gamma Kaplan-Meier (KM) Statistics			
k hat (KM)	0.212	nu hat (KM)	12.31
Approximate Chi Square Value (12.31, α)	5.43	Adjusted Chi Square Value (12.31, β)	5.158
95% Gamma Approximate KM-UCL (use when n>=50)	0.434	95% Gamma Adjusted KM-UCL (use when n<50)	0.457
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.168
Maximum	1.99	Median	0.01
SD	0.432	CV	2.576
k hat (MLE)	0.337	k star (bias corrected MLE)	0.325

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Theta hat (MLE)	0.0145	Theta star (bias corrected MLE)	0.0162
nu hat (MLE)	216.1	nu star (bias corrected)	193.4

Mean (detects)	0.058		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0563
Maximum	0.112	Median	0.0445

Number of Distinct Detects	1	Number of Distinct Non-Detects	1

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Gordon Site, Fish - Whole Body, Lead (Pb), mg/kg ww was not processed!

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% Student's-t UCL	6.604		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Mean (detects)	0.00319		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.002	Mean	0.00733
Maximum	0.01	Median	0.01

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	0.007		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.0063	Mean	0.00962
Maximum	0.01	Median	0.01

Mean (detects)	0.176		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma GOF Tests on Detected Observations Only			
A-D Test Statistic	1.116	**Anderson-Darling GOF Test**	
5% A-D Critical Value	0.734	Detected Data Not Gamma Distributed at 5% Significance Level	
K-S Test Statistic	0.276	**Kolmogorov-Smirnov GOF**	
5% K-S Critical Value	0.228	Detected Data Not Gamma Distributed at 5% Significance Level	
Detected Data Not Gamma Distributed at 5% Significance Level			
Gamma Statistics on Detected Data Only			
k hat (MLE)	23.88	k star (bias corrected MLE)	18.81
Theta hat (MLE)	0.0053	Theta star (bias corrected MLE)	0.00672
nu hat (MLE)	668.5	nu star (bias corrected)	526.6

Mean (detects)	0.126		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.0636
Maximum	0.21	Median	0.0558
SD	0.0473	CV	0.744
k hat (MLE)	1.571	k star (bias corrected MLE)	1.491
Theta hat (MLE)	0.0405	Theta star (bias corrected MLE)	0.0426
nu hat (MLE)	160.2	nu star (bias corrected)	152.1
Adjusted Level of Significance (β)	0.0453		
Approximate Chi Square Value (152.11, α)	124.6	Adjusted Chi Square Value (152.11, β)	123.9
95% Gamma Approximate UCL (use when n>=50)	0.0776	95% Gamma Adjusted UCL (use when n<50)	0.0781
Estimates of Gamma Parameters using KM Estimates			
Mean (KM)	0.107	SD (KM)	0.0191
Variance (KM)	3.6501E-4	SE of Mean (KM)	0.00278
k hat (KM)	31.52	k star (KM)	29.67

Suggested UCL to Use			
95% Student's-t UCL	2.7	or 95% Modified-t UCL	2.707
or 95% H-UCL	2.702		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.			

UCL Statistics for Data Sets with Non-Detects

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use			
95% H-UCL	527.3		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Mean (detects)	0.207		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.132

APPENDIX C.31
ADDITIONAL INFORMATION RELATED TO EPC SELECTION

Additional Information Related to EPC Selection

For some samples, measured baseline COPC concentrations were reported as being below the laboratory detection limits. In these situations, the concentrations can be represented as being present at the detection limit or as being present at half the detection limit. Using the detection limit concentration to represent these concentrations over-estimates the actual concentrations and this results in an over-estimation of the baseline EPC. This over-estimation of baseline conditions, in turn, results in an under-estimation of the Project's contribution to future environmental conditions by decreasing the Project's percent contribution to the Future Case concentration (Baseline + Project). To limit the over-estimation of baseline conditions, where measured baseline COPC concentrations were reported as less than the detection limit, a concentration equal to half the detection limit was used in the calculation of the EPC.

In the case of laboratory duplicates and field duplicates, the average of the parent sample and the duplicate sample was used in the calculation of the EPC. ProUCL data preparation included the following steps to calculate discrete results for duplicate samples:

1. Identify parent sample, field duplicate, laboratory duplicate of parent sample and laboratory duplicate of field duplicate.
2. Calculate average of the available concentrations using half the value of the detection limit for non-detects.
3. If all results are non-detect or the average from step B is less than the highest detection limit, use the highest detection limit and flag result as a non-detected value.

Selection of the UCLM based on the ProUCL Output was based on the following steps:

1. Select the highest of the "Suggested UCL to Use". Disregard H-statistic results due to their unstable (both high and low) tendencies.
2. If no "Suggested UCL to Use" are available, review the "Gamma Goodness of Fit (GOF) Test" results.
3. If GOF result indicates that the data is Gamma distributed, then select one of the two "95% Approximate Gamma UCL" results, depending on whether the number of observations is >=50 or <50.
4. If GOF result indicates that "Data Not Gamma Distributed at 5% Significance Level" then select the maximum UCL value from the 8 (95% UCL) listed in the "Nonparametric Distribution Free UCLs" section of the ProUCL output.
5. If the selected UCL is greater than the maximum value in the dataset, then select the maximum value
6. If the selected UCL is less than either the mean or the median, then select the highest of the mean or median.
7. In cases where analytical data is insufficient for ProUCL to provide UCL values, the maximum value between the detected and half of the non-detected concentration concentrations is selected.

Appendix D UBIQUITOUS ELEMENTS

APPENDIX D
UBIQUITOUS ELEMENTS

1.0 NON-TOXIC, UBIQUOUTOUS COMPOUNDS: ALUMINUM, BISMUTH, CALCIUM, IRON, MAGNESIUM, PHOSPHOROUS, POTASSIUM, SODIUM AND TITANIUM

Aluminum, bismuth, calcium, magnesium, phosphorous, potassium, sodium, tin and titanium were not considered to pose a risk for one or both of the following reasons: 1) these parameters are ubiquitous, naturally occurring elements that, in some cases, play a role in the proper function of biological systems; 2) these parameters are generally not regarded as being particularly toxic. These parameters are not included in the screening tables and are not evaluated in the HHERA.

Further support for not evaluating these elements is provided below.

1.1 ALUMINUM

Aluminum is the most common metal in the Earth's crust, with an average concentration of 82 300 mg/kg (Lide, 2004). In terms of toxicity, occupational exposures in the aluminum production industry have been found by IARC to be carcinogenic to humans (IARC, 1987), but the causative agents in these exposures are thought to be pitch volatiles, and not aluminum itself (IARC, 1987). Health Canada states that no consistent, convincing evidence exists that aluminum in drinking water causes adverse health effects in human receptors (HC, 1998). No studies could be located involving dermal exposure of humans or animals to aluminum, and no toxicity information could be found on the US EPA IRIS or in Health Canada documents; however, US EPA (2004) Region 9 does provide a provisional value for aluminum of 20000 mg/kg. Given the lack of toxicity information available, a quantitative evaluation of aluminum is considered unfeasible, and since it is very common in the environment, it is not expected to pose any excess risk through any pathway. No human health risks due to aluminum in media are therefore anticipated; therefore it has not been carried forward as a COPC in this assessment.

1.2 BISMUTH

Bismuth is considered a rare metal that is found in the earth's crust at an average concentration of 0.17 ppm or mg/kg in the Earth's crust (Geological Survey, NL). With its low solubility, it is considered non-toxic and is widely used in the pharmaceutical and cosmetic industry, It is the principal ingredient in the manufacture of an antiacid medication called Pepto-Bismol. Most Bismuth compounds are insoluble and poorly absorbed from the GI tract or when applied to the skin, even if the skin is abraded or burned (Goyer et. al. 2001). Due to its high density that is comparable to that of lead and due to its low toxicity, it has been used as a replacement for lead shots for the hunting of water fowl, as ingestion of lead shots by the birds lead to high mortality rates due to lead-poisoning. The *Migratory Birds Regulations* also includes gun shots made of bismuth as non-toxic shots (Canada, 1994). The low toxicity of bismuth has also allowed it to be used as a replacement for lead in soldering, plumbing fittings for drinking water systems and in food processing equipment (Suzuki et al., 2001). Given its low solubility and low toxicity, bismuth is expected to pose a negligible risk; therefore it has not been carried forward as a COPC in this assessment.

1.3 CALCIUM

Calcium is an essential mineral for living organisms, and one of the major components of bone in animals: in humans, over 99% of the calcium stored in the human body is found in the skeletal system (IOM, 1997). Calcium serves many functions in living organisms, but in the human body, its other major roles are the mediation of vascular contraction, vasodilation, muscle contraction, nerve transmission, and glandular secretion (IOM, 1997). It is also ubiquitous, as it makes up over 3% of the Earth's crust by weight, corresponding to an average concentration of 41 500 mg/kg (CRC, 2004), and is found at an average concentration of 412 mg/L in seawater. Given its essentiality and its common occurrence in the environment, calcium in environmental media is therefore not expected to contribute to excess health risks to human receptors and a quantitative assessment of the risk due to calcium is therefore considered unnecessary.

1.4 IRON

Iron is an essential nutrient which aids in the formation of haemoglobin, whose primary function is to transport oxygen in red blood cells. Anaemia is a deficiency condition that results from insufficient nutrient intake and can cause adverse health effects such as decreased cognitive performance and growth in children (WHO, 2006). Given that iron is an essential nutrient and a naturally occurring metal, toxicity reference values do not exist from any of the major regulatory agencies; however, US EPA Region 3 does provide a provisional value of 62000 mg/kg. Nevertheless, iron can still be excluded as a potential source of human health risk based upon its ubiquitous environmental nature and essential nutritional value.

1.5 MAGNESIUM

Magnesium is expected to be present in its ionic form in groundwater (CRC, 2004). Magnesium is an essential mineral for living organisms; the average adult human body contains about 25 g of magnesium (IOM, 1997). It is a required cofactor for various enzymes, and plays a role in both anaerobic and aerobic energy generation in the body, as part of the glycolysis and oxidative phosphorylation processes (IOM, 1997). It is also a fundamental component of chlorophyll in green plants (CRC, 2004). It makes up an average of 23 300 mg/kg of the Earth's crust, and can be found in seawater at an average concentration of 1290 mg/L. Because it is essential for life, and because it occurs commonly, magnesium is not expected to pose any excess health risk to the construction worker receptor through the dermal exposure to groundwater, and a quantitative evaluation is thus not necessary. The appropriate site specific standards for Magnesium were therefore set at the maximum measured concentrations.

1.6 PHOSPHOROUS

Making up an average of 1050 mg/kg of the Earth's crust, phosphorus in nature is most commonly found as phosphate (PO43-) (CRC, 2004), and is therefore assumed to be present in this form in the soil, sediment and water. Phosphorus, as phosphate, is an essential constituent of plant and animal tissues, where it plays several roles, including pH maintenance, catalytic protein activation, and energy transfer and temporary storage (IOM, 1997). Phosphorus itself makes up 0.65% to 1.1% of adult human body weight (IOM, 1997). Given its essentiality to life, and its relative abundance in the Earth's crust, phosphorus in the soil or water is not expected to pose any excess risk to receptors, and a quantitative evaluation for phosphorus is therefore considered unnecessary.

1.7 POTASSIUM

Potassium ions are required for plant growth (CRC, 2004), and for normal cellular function in both plants and animals (IOM, 2004). Potassium is also abundant in the Earth's crust, making up 2.4% of the crust by weight, at an average concentration of 29 000 mg/kg (CRC, 2004), and is present in seawater at a concentration of 399 mg/L (CRC, 2004). Given its ubiquity and its essentiality to life, it is therefore reasonable to conclude that potassium in the soil or water is not expected to result in excess risk to the construction worker, and a quantitative evaluation of this COPC is therefore considered unnecessary.

1.8 SODIUM

Sodium ions are essential to life, as they are required in living organisms to maintain extracellular fluid volume and serum osmolality (IOM, 2004). Given that sodium also makes up 2.6% of the Earth's crust, at an average concentration of 23 600 mg/kg (CRC, 2004), and exists in seawater at a concentration of 10 800 mg/L, combined with its essentiality to life, it is not expected that sodium in soil or water will pose excess risk to the human receptor, and a quantitative assessment of sodium is therefore considered unnecessary.

1.9 TITANIUM

Titanium exists in the Earth's crust at an average concentration of 5650 mg/kg (CRC, 2004). It does not exist in its metallic state in nature, but is found instead in ionic compounds such as titanium dioxide (WHO, 1982). Titanium has not been shown to be essential to life, but has a wide variety of uses in consumer products, including food additives, as a material for implants and prostheses, and several dermal applications (WHO, 1982). For instance, titanium dioxide is used in cosmetics, sunscreen, and anti- acne ointments, among other uses, with no reported adverse effects. Titanium tetrachloride, on the other hand, is corrosive, and irritates the skin, eyes, mucous membranes, and the lungs on exposure (ATSDR, 1997); as this compound is not found in the environment (ATSDR, 1997), however, it is not expected that the titanium at the Site would be in this form. Given its existing uses as a physiologically inert material, it is not expected that titanium will pose excess risk to exposure to humans and a quantitative evaluation of titanium is therefore considered inappropriate.

Appendix E EXAMPLE CALCULATIONS, DERMAL RAF, UPTAKE FACTORS

APPENDIX E
EXAMPLE CALCULATIONS, DERMAL RAF, UPTAKE FACTORS

APPENDIX E.1
EXAMPLE CALCULATIONS

Example calculations for exposure point concentrations (EPCs), human health exposures and human health and ecological health risks are provided below. The Baseline Case and Future Case EPCs are summarized in Section 4.0. The receptor characteristics for humans and ecological receptors are provided in Sections 5.0 and Section 6.0, respectively. The toxic reference values (TRVs) used for the assessment of human exposures are provided in Section 4.2 and the TRVs for ecological receptors are provided in **Appendix G**.

Exposure Point Concentrations

CALCULATION OF EXPOSURE POINT CONCENTRATION IN SOIL

WORKED EXAMPLE FOR FUTURE CASE ARSENIC CONCENTRATIONS IN SOIL IN THE GORDON REGION

(1) ***Calculate Total Deposition Rate of Arsenic at each Receptor Location in the Gordon region***

Total deposition rate is the sum of 5 times the yearly deposition rate for Gordon and 13 times the yearly deposition rate for MacLellan.

Where:

Predicted Deposition Rate of Arsenic at Potential Indigenous Receptor 1 (5 years of Deposition from Gordon)	=	1.18E-05 g/m^2/year x 5 years	=	5.91E-05 g/m^2
Predicted Deposition Rate of Arsenic at Potential Indigenous Receptor 1 (13 years of Deposition from MacLellan)	=	2.90E-05 g/m^2/year x 13 years	=	3.77E-04 g/m^2

Result:

Total Deposition Rate of Arsenic at Potential Indigenous Receptor 1 (end of mine life)	=	1.46E-04 g/m^2

(2) ***Calculate the 95% UCLM concentration for each metal for receptor locations in the Gordon region.***

Result:

95% UCLM of the Arsenic Deposition Rate for Receptor Locations in Gordon	=	1.24E-03 g/m^2

(3) ***Calculate the Concentration of Arsenic in Gordon region soil due to deposition. Assume a 1m x 1m plot and a 0.02 m mixing depth.***

Where:

95% UCLM of the Arsenic Deposition Rate for Receptor Locations in Gordon	=	1.24E-03 g/m^2

Weight of Top 2 cm per 1m^2 Area of Soil	=	Weight of the surface horizon of 1 m^2 area of untilled soil that is assumed to be mixed with Arsenic deposited at the end of project operations at the Gordon region
	=	*Area of Soil Plot x Mixing Depth of Metals in Soil x Soil Bulk Density*
Area of Soil Plot	=	1 m^2
Mixing Depth Thickness	=	2 cm or 0.02 m
Soil Bulk Density	=	1000 kg/m^3

Results:

Weight of Top 2 cm per 1 m^2 area of Soil	=	0.02 m x 1000 kg/m^3 = 2.00E+01 kg/m^2
Concentration of Arsenic in Soil due to Deposition	=	(1.24E-03 g/m^2) / (2.00E+01 kg/m^2) = 6.20E-02 mg/kg

(4) *Calculation of Future Case Exposure Point Concentration of Arsenic in Soil in the Gordon Region*

Future Case Concentration of Arsenic = *Baseline Concentration of Arsenic* + *Concentration of Arsenic*

Where:

Baseline Concentration of Arsenic (Measured Concentration)	=	1.09E+00 mg/kg
Concentration of Arsenic in Soil due to Deposition	=	6.20E-02 mg/kg

Result:

Future Case Concentration of Arsenic in soil in Gordon region.	=	1.15E+00 mg/kg

CALCULATION OF EXPOSURE POINT CONCENTRATION IN SEDIMENT

WORKED EXAMPLE FOR FUTURE CASE ARSENIC CONCENTRATIONS IN SEDIMENT IN THE GORDON REGION

$$EPC_{sed\ (future)} = EPC_{sed\ (baseline)} + \Delta EPC_{sed}$$

And:

$$\Delta EPC_{sed} = \Delta EPC_{sw} \times KD_{site\ specific}$$

$$\Delta EPC_{sw} = EPC_{sw\ future} - EPC_{sw\ baseline}$$

$$KD_{site\ specific} = \frac{FOC \times KD_{literature}}{FOC_{deep}}$$

Where:

FOC_{deep}	:	Fraction of organic carbon in biogenic deep sediment (mg/kg)	=	2.00E-01 mg/kg
FOC	:	Fraction of organic carbon in sediment (mg/kg)	=	1.49E-01 mg/kg
$KD_{literature}$	:	Partition coefficient from surface water to sediment (Sheppard et. al. 2010) (L/kg)	=	1.40E+03 L/kg
$EPC_{sw\ future}$	:	Predicted future Exposure Point Concentrations of Arsenic in surface water in the Gordon region (mg/L)	=	5.84E-04 mg/L
$EPC_{sw\ baseline}$	:	Measured Exposure Point Concentration of Arsenic in water under Baseline conditions in the Gordon region (mg/L)	=	2.93E-04 mg/L
$EPC_{sed\ (baseline)}$	:	Measured Exposure Point Concentration of Arsenic in sediment under Baseline conditions in the Gordon region (mg/kg)	=	4.99E+00 mg/kg

Result:

$KD_{site\ specific}$	:	Partition coefficient from surface water to sediment in the Gordon region (L/kg)	=	1.05E+03 L/kg
ΔEPC_{sw}	:	Predicted change of Arsenic Exposure Point Concentration in surface water between Baseline and Future Case in the Gordon region (mg/L)	=	2.91E-04 mg/L
ΔEPC_{sed}	:	Predicted change of Arsenic Exposure Point Concentration in sediment between Baseline and Future Case in the Gordon region (mg/kg)	=	3.04E-01 mg/kg
$EPC_{sed\ (future)}$	:	Predicted Future Arsenic Exposure Point Concentration of Arsenic in sediment in the Gordon region (mg/kg)	=	5.30E+00 mg/kg

CALCULATION OF EXPOSURE CONCENTRATION IN AIR

WORKED EXAMPLE FOR FUTURE CASE COPC CONCENTRATIONS IN AIR IN THE GORDON REGION

Example Calculation of Future Case Inhalation Exposures to 1-hour SO_2, 24-hour SO_2 and Annual NO_2 in the Gordon Region

$$SO_{2\ (Future\ Case)} = SO_{2\ (\text{Max 99th Perc 1-hour})} + SO_{2\ (Background\ \text{99th Perc 1-hour})}$$

Where:

$SO_{2\ (Max\ 99th\ Perc\ 1\text{-}hour)}$	:	Maximum of modelled 99th Percentile Daily Maximum 1-hour SO_2 based on Project operations at the Gordon Region (µg/m³)	=	3.87E+01 µg/m³
$SO_{2\ (Bg\ 99th\ Perc\ 1\text{-}hour)}$	:	Measured Background 99th Percentile Daily Maximum 1-hour SO_2 (µg/m³)	=	6.00E+00 µg/m³

Result:

$SO_{2\ (Future\ Case)}$	:	Future Case Exposure Point Concentration of 1-hour SO_2 at the Gordon Region (µg/m³)	=	4.47E+01 µg/m³

CALCULATION OF EXPOSURE POINT CONCENTRATION IN FISH FOR HUMAN CONSUMPTION

WORKED EXAMPLE FOR EXPOSURE POINT CONCENTRATION IN FISH AND THE PROPORTIONING APPROACH

Calculation of Predicted Future Case Arsenic Concentration in Fish Tissue Using Predicted Future Case Arsenic Concentration in Water in the Gordon region (Swede Lake)

$$EPC_{Fish\ (Future)} = \frac{EPC_{Fish\ carcass\ (Future)} + EPC_{Fish\ liver\ (Future)} + EPC_{Fish\ muscle\ (Future)}}{3}$$

And:

$$EPC_{Fish\ muscle\ (\ Future)} = Expected\ Magnitude\ Change \times\ EPC_{Fish\ muscle(Measured\ Baseline)}$$

$$Expected\ Magnitude\ Change = \frac{EPC_{Fish(Pred.\ Future)}}{EPC_{Fish(\ Pred.Baseline)}}$$

$$EPC_{Fish(Pred.\ Future)} = EPC_{Water\ (Future)} \times UP_{Fish\ (Future)}$$

$$EPC_{Fish(Pred.\ Baseline)} = EPC_{Water\ (Baseline)} \times UP_{Fish\ (Baseline)}$$

Where:

$EPC_{Fish\ muscle\ (measured\ baseline)}$	:	Measured Exposure Point Concentration of Arsenic in Fish tissue (muscle) under Baseline conditions (mg/kg wet weight) (95% UCLM concentration)	=	6.36E-02 mg/kg wet weight
$EPC_{Water\ (Baseline)}$	:	Baseline Exposure Point Concentration of Arsenic in surface water of Swede Lake (Gordon region) (mg/L)	=	2.87E-04 mg/L
$EPC_{Water\ (Future)}$	:	Modelled Future Exposure Point Concentration of Arsenic in surface water of Swede Lake (Gordon region) (mg/L)	=	7.07E-04 mg/L
$UP_{Fish\ (Baseline)}$	:	Uptake Factor for Arsenic uptake in Fish from surface water under Baseline conditions (mg/kg wet-tissue / mg/L water)	=	50 mg/kg-wet tissue/ mg/L-water wet tissue

$UP_{Fish\ (Future)}$	:	Uptake Factor for Arsenic uptake in Fish from surface water under Future Case conditions (mg/kg wet-tissue / mg/L water)	=	50 mg/kg-wet tissue/ mg/L-water wet tissue
$EPC_{Fish\ carcass\ (Future)}$	:	Calculated Exposure Point Concentration of Arsenic in Fish Tissue (carcass) based on Future Case conditions using the proportioning approach. Calculations similar to that of $EPC_{Fish\ muscle\ (Future)}$ (mg/kg wet weight)	=	1.28E-01 mg/kg wet weight
$EPC_{Fish\ liver\ (Future)}$	:	Calculated Exposure Point Concentration of Arsenic in Fish Tissue (liver) based on Future Case conditions using the proportioning approach. Calculations similar to that of $EPC_{Fish\ muscle\ (Future)}$ mg/kg wet weight)	=	1.36E-01 mg/kg wet weight

Results:

$EPC_{Fish(Pred.\ Baseline)}$	:	Predicted Exposure Point Concentration of Arsenic in Fish based on uptake of Arsenic in water under Baseline conditions (mg/kg wet weight)	=	1.43E-02 mg/kg wet weight
$EPC_{Fish(Pred.\ Future)}$	:	Predicted Exposure Point Concentration of Arsenic in Fish based on uptake of Arsenic in water under Future Case conditions (mg/kg wet weight)	=	3.53E-02 mg/kg wet weight
$Expected\ Magnitude\ Change$	:	Expected Magnitude of Change in Arsenic concentrations in Fish based on predicted change in Arsenic concentrations in water (unitless)	=	2.46E+00
$EPC_{Fish\ muscle\ (Future)}$	:	Exposure Point Concentration of Arsenic in Fish Tissue (muscle) based on Future Case conditions using the proportioning approach (mg/kg wet weight)	=	1.57E-01 mg/kg wet tissue
$EPC_{Fish\ (Future)}$	:	Average of all Predicted Exposure Point Concentration of Arsenic in Fish tissue (carcass, liver, muscle) based on Future Case conditions using the proportioning approach (mg/kg wet weight)	=	1.40E-01 mg/kg wet weight

CALCULATION OF EXPOSURE POINT CONCENTRATION IN MOOSE MEAT

Calculation for the concentration of arsenic in moose tissue from the consumption of soil and plants (terrestrial and aquatic) under Future Case conditions in the Gordon Region

$$A_{moose} = \left(\sum (F_p \times Qp_{ter} \times P_{ter}) + (F_p \times Qp_{aq} \times P_{aq}) \times (Fs \times Qs \times Bs \times Cs) + (F_W \times Qw \times Cw) + (F_{sed} \times Q_{sed} \times C_{sed})\right) \times Ba_{moose} \times MF$$

And:

$$Ba_{moose} = \frac{L_{moose\%}}{L_{beef\%}} \times Ba_{beef}$$

Where:

Ba_{beef}	:	Arsenic biotransfer factor for beef (day/kg FW tissue)	=	2.00E-03 day/kg FW tissue
$L_{beef\%}$	:	Lipid content in beef cattle (%)	=	19%
$L_{moose\%}$	:	Lipid content in moose (%)	=	10%
MF	:	Metabolism Factor (unitless)	=	1.00E+00
Fp	:	Fraction of plant type (terrestrial and aquatic) ingested by the moose (unitless)	=	1.00E+00
Qp_{ter}	:	Quantity of terrestrial plant eaten by the moose per day (kg DW plant / day)	=	6.40E+00 kg/day
Qp_{aq}	:	Quantity of plant type (aquatic) eaten by the moose per day (kg DW plant / day)		1.60E+00 kg/day
P_{ter}	:	Concentration of Arsenic in terrestrial plants eaten by the moose (mg/kg DW)	=	9.57E-02 mg/kg
P_{aq}	:	Concentration of Arsenic in aquatic plants eaten by the moose (mg/kg DW)		1.99E-01 mg/kg
F_s	:	Fraction of soil contaminated and ingested by the moose (unitless)	=	1.00E+00
Qs	:	Quantity of soil eaten by the moose each day (kg/day)	=	1.20E-01 kg/day
Bs	:	Soil bioavailability factor (unitless)	=	1.00E+00
Cs	:	Average soil concentration over exposure duration (mg Arsenic/kg soil)	=	1.15E+00 mg/kg
F_W	:	Fraction of water contaminated and ingested by the moose (unitless)	=	1.00E+00
Qw	:	Quantity of water taken up by the moose per day (L/day)	=	2.16E+01 L/day
Cw	:	Arsenic concentration in water (maximum concentration of water taken from lake (mg/L)	=	5.84E-04 mg/L
F_{sed}	:	Fraction of sediment contaminated and ingested by the moose (unitless)	=	1.00E+00
Q_{sed}	:	Quantity of sediment eaten by the moose per day (kg DW/day)	=	2.60E-02 kg/day

C_{sed} : Arsenic concentration in sediment (mg Arsenic/kg soil) = 5.30E+00 mg/kg

Results:

Ba_{moose} : Arsenic biotransfer factor for moose (day/kg FW tissue) = 1.05E-03 day/kg

A_{moose} : Arsenic concentration in moose meat in the Gordon Region under Future Case conditions (mg Arsenic/kg FW tissue) = 1.28E-03 mg/kg FW tissue

Human Health

CALCULATION OF LIFETIME AVERAGED DAILY INHALATION EXPOSURES

Calculation of Lifetime Averaged Daily Concentration (LADC) of Arsenic in air during Project Alone Case in the Gordon Region

$$LADC_{(Inhalation)} = As_{(Max\ Annual)} \times AF$$

And:

$$AF_{(Project)} = T_{(Project\ Operations)} \div T_{(Lifetime)}$$

Where:

$T_{(Lifetime)}$: Average lifetime of human receptors in years = 80 years

$T_{(Project\ Operations)}$: Estimated duration of project operations in years = 13 years

$As_{(Max\ Annual)}$: Maximum modelled annual concentration of Arsenic in air in the Gordon region based on Future Case conditions ($\mu g/m^3$) = 5.59E-05 $\mu g/m^3$

Result:

$AF_{(Project)}$: Averaging Factor for inhalation exposures to carcinogenic chemicals (unitless) = 1.63E-01

$LADC_{(Inhalation)}$: Lifetime Averaged Daily Concentration of Arsenic in air based on Project Alone Case conditions in the Gordon region ($\mu g/m^3$) = 9.08E-06 $\mu g/m^3$

CALCULATION OF NON-CARCINOGENIC INGESTION EXPOSURES (ORAL AND DERMAL) OF COPCS BY INDIGENOUS TODDLER RECEPTOR AT GORDON UNDER BASELINE CONDITIONS

(1) *Calculation of Chronic Daily Intake of Soil through Oral Ingestion*

$$CDI_{Ingestion} = \frac{C_{soil} \times IR_{soil} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

Where:

C_{soil}	:	Maximum Baseline Arsenic concentration in soil (mg/kg)	=	1.09E+00 mg/kg
IR_{soil}	:	Soil Ingestion Rate (g/day)	=	8.00E-02 g/day
CF	:	Conversion Factor (kg to g)	=	1E-03 g/kg
AF_{GIT}	:	Absorption Factor from the Gastrointestinal Tract (unitless)	=	1.00E+00
D_1	:	Days per week exposed (7) / 7 days (unitless)	=	1.0
D_2	:	Weeks per year exposed (52) / 52 weeks (unitless)	=	1.0
BW	:	Average body weight of receptor (kg)	=	1.65E+01 kg

Result:

$CDI_{Ingestion}$	:	Chronic daily intake from ingestion (mg/kg/day)	=	5.28E-06 mg/kg/day

(2) *Calculation of Chronic Daily Intake of Soil through Dermal Contact*

$$CDI_{Dermal} = \frac{C_{soil} \times SA_{total} \times SF \times AF_{skin} \times CF \times D_1 \times D_2}{BW}$$

Where:

C_{soil}	:	Maximum Baseline Arsenic concentration in soil (mg/kg)	=	1.09E+00 mg/kg
SA_{total}	:	Total skin surface area of hands upper and lower arms and upper and lower legs (cm^2)	=	3.01E+03 cm^2
SF	:	Soil Adhesion Factor (g/cm^2)	=	2.29E-05 g/cm^2
AF_{skin}	:	Dermal Absorption Factor (unitless)	=	3.00E-02
CF	:	Conversion Factor (kg to g)	=	1.00E-03 g/kg
D_1	:	Days per week exposed (7) / 7 days	=	1.00
D_2	:	Weeks per year exposed (52) / 52 weeks	=	1.00
BW	:	Average body weight of receptor (kg)	=	1.65E+01 kg

Result:

CDI Dermal	:	Chronic daily intake from dermal contact (mg/kg/day)	= 1.36E-07 mg/kg/day

(3) *Calculation of Chronic Daily Intake of Arsenic through Consumption of Fish by Indigenous Toddler Receptor at Gordon (Baseline Case)*

$$CDI_{Fish} = \frac{EPC_{\text{Fish (Baseline)}} \times IR_{fish} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

Where:

$EPC_{\text{Fish (Baseline)}}$	:	Baseline Exposure Point Concentration of Arsenic in Fish (mg/kg wet weight) = Average of 95% UCLM concentration of Arsenic in fish carcass, fish liver and fish muscle (mg/kg wet weight)	= 5.69E-02 mg/kg wet weight
IR_{fish}	:	Ingestion rate of local fish (g/day)	= 1.57E+00
CF	:	Conversion Factor (kg to g)	= 1.00E-03 g/kg
AF_{GIT}	:	Absorption Factor from the Gastrointestinal Tract (unitless)	= 1.00
D_1	:	Days per week exposed (7) / 7 days	= 1.00
D_2	:	Weeks per year exposed (52) / 52 weeks	= 1.00
BW	:	Average body weight of Toddler	= 1.65E+01 kg

Result:

CDI_{Fish}	:	Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through consumption of Fish under Baseline conditions	= 5.41E-06 mg/kg/day

(4) *Calculation of Chronic Daily Intake of Arsenic through Consumption of Wild Meat by Indigenous Toddler Receptor at Gordon (Baseline Case)*

$$CDI_{Wild\ Meat} = CDI_{Lg\ Mam} + CDI_{Sm\ Mam} + CDI_{Aq\ Mam} + CDI_{Tr\ Bir} + CDI_{Wt\ Fow}$$

And:

$$CDI_{Lg\ Mam} = \frac{C_{\text{Lg Mam (Baseline)}} \times IR_{Lg\ Mam} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

$$CDI_{Sm\ Mam} = \frac{C_{\text{Sm Mam (Baseline)}} \times IR_{Sm\ Mam} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

$$CDI_{Aq\ Mam} = \frac{C_{\text{Aq Mam (Baseline)}} \times IR_{Aq\ Mam} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

$$CDI_{Tr\ Bir} = \frac{C_{\text{Tr Bir (Baseline)}} \times IR_{Tr\ Bir} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

$$CDI_{Wt\ Fow} = \frac{C_{\text{Wt Fow (Baseline)}} \times IR_{Wt\ Fow} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

Where:

$C_{\text{Lg Mam (Baseline)}}$	:	Concentration of Arsenic in large mammal tissue under Baseline conditions (mg/kg wet wight)	=	1.21E-03 mg/kg wet weight
$C_{\text{Sm Mam (Baseline)}}$	:	Concentration of Arsenic in small mammal tissue under Baseline conditions (mg/kg wet wight)	=	1.31E-05 mg/kg wet weight
$C_{\text{Aq Mam (Baseline)}}$	:	Concentration of Arsenic in aquatic mammal tissue under Baseline conditions (mg/kg wet wight)	=	4.78E-05 mg/kg wet weight
$C_{\text{Tr Bir (Baseline)}}$	:	Concentration of Arsenic in terrestrial bird tissue under Baseline conditions (mg/kg wet wight)	=	7.46E-06 mg/kg wet weight
$C_{\text{Wt Fow (Baseline)}}$	:	Concentration of Arsenic in water fowl tissue under Baseline conditions (mg/kg wet wight)	=	2.78E-04 mg/kg wet weight
$IR_{\text{Lg Mam}}$	:	Ingestion Rate of large mammal meat (g/day)	=	1.80E+01 g/day
IR_{SmMam}	:	Ingestion Rate of small mammal meat (g/day)	=	1.56E+00 g/day
$IR_{\text{Aq Mam}}$	:	Ingestion Rate of aquatic mammal meat (g/day)	=	5.76E-01 g/day
$IR_{\text{Tr Bir}}$	:	Ingestion Rate of terrestrial bird meat (g/day)	=	6.11E-01 g/day
$IR_{\text{Wt Fow}}$	:	Ingestion Rate of water fowl meat (g/day)	=	1.04E+01 g/day
CF	:	Conversion Factor (g to kg)	=	1.00E-03 kg/g
AF_{GIT}	:	Absorption Factor from the Gastrointestinal Tract (unitless)	=	1.00
D_1	:	Days per week exposed (7) / 7 days	=	1.00
D_2	:	Weeks per year exposed (52) / 52 weeks	=	1.00
BW	:	Average body weight of toddler	=	1.65E+01 kg

Results:

$CDI_{Lg\ Mam}$	:	Chronic Daily Intake of Arsenic through consumption of meat of large mammals	=	1.32E-06 mg/kg/day
$CDI_{Sm\ Mam}$	:	Chronic Daily Intake of Arsenic through consumption of meat of small mammals	=	1.24E-09 mg/kg/day
$CDI_{Aq\ Mam}$	:	Chronic Daily Intake of Arsenic through consumption of meat of aquatic mammals	=	1.67E-09 mg/kg/day

$CDI_{Tr\ Bir}$	:	Chronic Daily Intake of Arsenic through consumption of meat of terrestrial birds	= 2.76E-10 mg/kg/day
$CDI_{Wt\ Fow}$	:	Chronic Daily Intake of Arsenic through consumption of water fowl	= 1.74E-07 mg/kg/day
$CDI_{Wild\ Meat}$	:	Chronic Daily Intake of Arsenic through consumption of all wild meat at Gordon under Baseline conditions	= 1.50E-06 mg/kg/day

(5) ***Calculation of Chronic Daily Intake of Arsenic through Consumption of Traditional Plants by Indigenous Toddler Receptor at Gordon (Baseline Case)***

$$CDI_{Total\ \ Pla} = CDI_{Berries} + CDI_{Ot\ Pla}$$

And:

$$CDI_{Berries} = \frac{C_{\text{Ber (Baseline)}} \times IR_{Ber} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

$$CDI_{Ot\ Pla} = \frac{C_{\text{Ot Pla (Baseline)}} \times IR_{Ot\ Pla} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

Where:

$C_{\text{Ber (Baseline)}}$	:	Concentration of Arsenic in Berries Tissue under Baseline conditions (mg/kg wet wight)	= 9.60E-03 mg/kg wet weight
$C_{\text{Ot Pla (Baseline)}}$	:	Concentration of Arsenic in Other Traditional Plant Tissue under Baseline conditions (mg/kg wet wight)	= 1.38E-02 mg/kg wet weight
IR_{Ber}	:	Ingestion Rate of Berries (g/day)	= 1.62E+01 g/day
$IR_{Oth\ Pla}$	:	Ingestion Rate of Other Traditional Plants (g/day)	= 4.75E+00 g/day
CF	:	Conversion Factor (g to kg)	= 1.00E-03 kg/g
AF_{GIT}	:	Absorption Factor from the Gastrointestinal Tract (unitless)	= 1.00
D_1	:	Days per week exposed (7) / 7 days	= 1.00
D_2	:	Weeks per year exposed (52) / 52 weeks	= 1.00
BW	:	Average body weight of toddler	= 1.65E+01 kg

Results:

$CDI_{Berries}$	:	Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Berries at Gordon under Baseline conditions (mg/kg/day)	= 9.42E-06 mg/kg/day
$CDI_{Ot\ Pla}$	:	Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Other Traditional Plants at	= 3.97E-06 mg/kg/day

		Gordon under Baseline conditions (mg/kg/day)	
$CDI_{Total\ Pla}$	:	Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Berries and Other Traditional Plants at Gordon under Baseline conditions (mg/kg/day)	= 1.34E-05 mg/kg/day

(6) ***Calculation of Chronic Daily Intake of Arsenic through Consumption of Garden Produce by Indigenous Toddler Receptor at Gordon (Baseline Case)***

$$CDI_{Produce} = \frac{C_{\text{Prod (Baseline)}} \times IR_{Prod} \times CF \times AF_{GIT} \times D_1 \times D_2}{BW}$$

Where:

$C_{\text{Prod (Baseline)}}$	:	Concentration of Arsenic in Garden (Backyard) Produce under Baseline conditions (mg/kg wet weight)	= 8.35E-03 mg/kg wet weight
IR_{Prod}	:	Ingestion Rate of Garden (Backyard) Produce (assume 10% of intake of vegetables from garden produce).	= 1.72E+01 g/day
CF	:	Conversion Factor (g to kg)	= 1.00E-03 kg/g
AF_{GIT}	:	Absorption Factor from the Gastrointestinal Tract (unitless)	= 1.00
D_1	:	Days per week exposed (7) / 7 days	= 1.00
D_2	:	Weeks per year exposed (52) / 52 weeks	= 1.00
BW	:	Average body weight of toddler	= 1.65E+01 kg

Result:

$CDI_{Produce}$	:	Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Garden (Backyard) Produce at Gordon under Baseline conditions (mg/kg/day)	= 8.70E-06 mg/kg/day

Calculation of Lifetime Averaged Daily Dose of Arsenic for Indigenous Receptor exposed to Arsenic through soil ingestion in the Gordon Region (Future Case)

$$LADD_{ingestion} = \left(\frac{\text{ED}_i}{\text{LE}} \times DI_i\right) + \left(\frac{\text{ED}_t}{\text{LE}} \times DI_t\right) + \left(\frac{\text{ED}_c}{\text{LE}} \times DI_c\right) + \left(\frac{\text{ED}_{\text{teen}}}{\text{LE}} \times DI_{teen}\right) + \left(\frac{\text{ED}_a}{\text{LE}} \times DI_a\right)$$

Where:

ED_i	:	Exposure duration for an infant in years	= 5.00E-01 years

ED_t	:	Exposure duration for a toddler in years	= 4.50E+00 years
ED_c	:	Exposure duration for a child in years	= 4.00E+00 years
ED_{teen}	:	Exposure duration for a teen in years	= 8.00E+00 years
ED_a	:	Exposure duration for an adult in years	= 6.00E+01 years
LE	:	Life Expectancy	= 80 years
DI_i	:	Soil ingestion daily intake for a toddler (mg/kg-day)	= 2.80E-06 mg/kg/day
DI_t	:	Soil ingestion daily intake for a toddler (mg/kg-day)	= 5.58E-06 mg/kg/day
DI_c	:	Soil ingestion daily intake for a child (mg/kg-day)	= 6.99E-07 mg/kg/day
DI_{teen}	:	Soil ingestion daily intake for a teen (mg/kg-day)	= 3.85E-07 mg/kg/day
DI_a	:	Soil ingestion daily intake for an adult (mg/kg-day)	= 3.25E-07 mg/kg/day

Result:

$LADD_{Ingestion}$	:	Lifetime Averaged Daily Dose of Arsenic through ingestion of soil by Indigenous Receptor in Gordon region (mg/kg/day)	= 6.75E-07 mg/kg/day

CALCULATION OF HEALTH RISKS FROM INHALATION

WORKED EXAMPLE FOR FUTURE CASE INHALATION RISKS ON EXPOSURE TO COPC IN AIR IN THE GORDON REGION

(1) ***Calculation of Concentration Ratio for 1-hour SO_2 exposures to Receptors in the Gordon Region under Future conditions***

$$CR_{(Future\ Case)} = \frac{SO_{2\ (Future\ Case)}}{TRV}$$

Where:

$SO_{2\ (Future\ Case)}$	:	Calculate Future Case Exposure Point Concentration of 1-hour SO_2 at the Gordon Region (µg/m^3)	= 4.47E+01 µg/m^3
TRV	:	Toxicological Reference Value for 1-hour SO_2 (µg/m^3)	= 1.70E+02 µg/m^3

Result:

$CR_{(Future\ Case)}$	:	Concentration Ratio for 1-hour SO_2 inhalation exposures to receptors in the Gordon region under Future conditions	= 2.63E-01

(2) ***Calculation of Concentration Ratio for 24-hour SO_2 exposures to Receptors in the Gordon Region under Future conditions***

$$CR_{(Future\ Case)} = \frac{SO_{2\ (Future\ Case)}}{TRV}$$

Where:

$SO_{2\ (Future\ Case)}$	:	Calculate Future Case Exposure Point Concentration of 24-hour SO_2 at the Gordon Region (µg/m^3)	= 1.35E+01 µg/m^3
TRV	:	Toxicological Reference Value for 24-hour SO_2 (µg/m^3)	= 1.25E+02 µg/m^3

Result:

$CR_{(Future\ Case)}$	:	Concentration Ratio for 24-hour SO_2 inhalation exposures to receptors in the Gordon region under Future conditions	= 1.08E-01

(3) ***Calculation of Concentration Ratio for Annual NO_2 exposures to Receptors in the Gordon Region under Future conditions***

$$CR_{(Future\ Case)} = \frac{NO_{2\ (Future\ Case)}}{TRV}$$

Where:

$NO_{2\ (Future\ Case)}$	:	Calculated Future Case Exposure Point Concentrations of Annual NO_2 at the Gordon Region (µg/m^3)	= 3.61E+00 µg/m^3
TRV	:	Toxicological Reference Value for Annual NO_2 (µg/m^3)	= 2.30E+01 µg/m^3

Result:

$CR_{(Future\ Case)}$	:	Concentration Ratio for Annual NO_2 inhalation exposures to receptors in the Gordon region under Future conditions	= 1.57E-01

(4) ***Calculation of Concentration Ratio for long-term inhalation exposures to carcinogenic Arsenic in the Gordon region based on emissions during Project Alone Case conditions***

$$CR_{(Project\ )} = \frac{LADC_{\ (Inhalation)}}{TRV_{\ RsC}}$$

And:

$$TRV_{\ RsC} = \frac{Cancer_{\ (Benchmark)}}{TRV_{Unit\ Risk}}$$

Where:

$Cancer_{(Benchmark)}$	:	Benchmark for carcinogenic risks (unitless)	= 1.00E-05
$TRV_{Unit\ Risk}$	:	Toxicological Reference Value (Inhalation Unit Risk) for carcinogenic Arsenic in air $(\mu g/m^3)^{-1}$	= 6.40E-03 $(\mu g/m^3)^{-1}$
$LADC_{(Inhalation)}$	:	Calculated Lifetime Averaged Daily Concentration of Arsenic in air based on Project Alone Case conditions in the Gordon region $(\mu g/m^3)$	= 9.08E-06 $\mu g/m^3$

Result:

TRV_{RsC}	:	Toxicological Reference Value (Reference Concentration) for carcinogenic Arsenic in air $(\mu g/m^3)$	= 1.56E-03 $\mu g/m^3$
$CR_{(Project)}$		Concentration Ratio for inhalation exposures of carcinogenic Arsenic in air by receptors in the Gordon region based on Project Alone Case conditions (unitless)	= 5.82E-03

CALCULATION OF HEALTH RISKS FROM INGESTION OF SOIL

Calculation of HQ for Arsenic through Ingestion of Soil by Indigenous Toddler Receptor at Gordon (Baseline Case)

$$HQ_{Total\ Soil} = HQ_{Inc\ Ing} + HQ_{Derm\ Con}$$

And:

$$HQ_{Inc\ Ing} = \frac{CDI_{Ingestion}}{TRV}$$

$$HQ_{Derm\ Con} = \frac{CDI_{Dermal}}{TRV}$$

Where:

TRV	:	Toxicological Reference Value for Arsenic [NOTE: TRV obtained from US EPA IRIS 1991. Arsenic. Available at: https://cfpub.epa.gov/ncea/iris/iris_documents/documents/subst/0278_summary.pdf#nameddest=rfd]	= 3.00E-04 mg/kg/day
$CDI_{Ingestion}$	:	Calculated Chronic daily intake from ingestion by Toddler (mg/kg/day)	= 5.28E-06 mg/kg/day
CDI_{Dermal}	:	Calculated Chronic daily intake from dermal contact by Toddler (mg/kg/day)	= 1.36E-07 mg/kg/day

Results:

$HQ_{Inc\ Ing}$	:	Hazard Quotient for Arsenic through incidental soil ingestion by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless)	= 1.76E-02
$HQ_{Derm\ Con}$	:	Hazard Quotient for Arsenic through dermal contact with soil by the Indigenous Toddler	= 4.54E-04

Receptor at Gordon under Baseline conditions (unitless)

$HQ_{Total\ Soil}$: Hazard Quotient for Arsenic through dermal contact of soil and incidental ingestion of soil by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 1.80E-02

CALCULATION OF HEALTH RISKS FROM TOTAL INGESTION- SOIL AND FOOD

Calculation of HQ for Arsenic through Total Ingestion of Soil and Food by Indigenous Toddler Receptor at Gordon (Baseline Case)

$$HQ_{Total} = HQ_{Total\ Soil} + HQ_{Fish} + HQ_{Wild\ Meat} + HQ_{Total\ Pla} + HQ_{Produce}$$

And:

$$HQ_{Fish} = \frac{CDI_{Fish}}{TRV}$$

$$HQ_{Wild\ Meat} = \frac{CDI_{Wild\ Meat}}{TRV}$$

$$HQ_{Total\ Pla} = \frac{CDI_{Total\ Pla}}{TRV}$$

$$HQ_{Produce} = \frac{CDI_{Prod}}{TRV}$$

Where:

TRV : Oral Toxicological Reference Value for Arsenic (mg/kg/day) = 3.00E-04 mg/kg/day

[NOTE: TRV obtained from US EPA IRIS 1991. Arsenic. Available at: https://cfpub.epa.gov/ncea/iris/iris_documents/documents/subst/0278_summary.pdf#nameddest=rfd]

$HQ_{Total\ Soil}$: Calculated Hazard Quotient for Arsenic through dermal contact of soil and incidental ingestion of soil by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 1.80E-02

CDI_{Fish} : Calculated Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through consumption of Fish under Baseline conditions (mg/kg/day) = 5.41E-06 mg/kg/day

$CDI_{Wild\ Meat}$: Calculated Chronic Daily Intake of Arsenic through consumption of all wild meat at Gordon under Baseline conditions (mg/kg/day) = 1.50E-06 mg/kg/day

$CDI_{Total\ Pla}$: Calculated Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Berries and Other Traditional = 1.34E-05 mg/kg/day

Plants at Gordon under Baseline conditions (mg/kg/day)

$CDI_{Produce}$: Calculated Chronic Daily Intake of Arsenic by Indigenous Toddler Receptor through the consumption of Garden (Backyard) Produce at Gordon under Baseline conditions (mg/kg/day) = 8.70E-06 mg/kg/day

Results:

HQ_{Fish} : Hazard Quotient for Arsenic through the daily intake of fish by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 1.80E-02

$HQ_{Wild\ Meat}$: Hazard Quotient for Arsenic through the daily intake of wild meat by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 4.99E-03

$HQ_{Total\ Pla}$: Hazard Quotient for Arsenic through the daily intake of berries and other traditional plants by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 4.46E-02

$HQ_{Produce}$: Hazard Quotient for Arsenic through the daily intake of garden (backyard) produce by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 2.90E-02

HQ_{Total} : Hazard Quotient for Arsenic through the daily intake of soil and food by the Indigenous Toddler Receptor at Gordon under Baseline conditions (unitless) = 1.15E-01

CALCULATION OF INCREMENTAL LIFETIME CANCER RISK (ILCR) FROM INGESTION OF SOIL

Incremental Lifetime Cancer Risk (ILCR) for the Indigenous Receptor exposed to Arsenic via soil ingestion in the Gordon Region (Project Case)

$$ILCR_{Ingestion} = LADD_{Ingestion} \times SF_{Oral}$$

Where:

$LADD_{Ingestion}$: Calculated Lifetime Averaged Daily Dose of Arsenic through ingestion of soil by Indigenous Receptor in Gordon region (mg/kg/day) = 6.75E-07 mg/kg/day

SF_{Oral}	:	Oral Slope Factor (Toxicological Reference Value) $(mg/kg/day)^{-1}$	= 1.80E+00 $(mg/kg/day)^{-1}$

Result for Future Case:

$ILCR_{Ingestion}$	:	Incremental Lifetime Cancer Risk (unitless) for Indigenous Receptor exposed to Arsenic via soil ingestion in the Gordon Region during Future Case.	= 1.21473 E-06

Result for Baseline Case:

$ILCR_{Ingestion}$	:	Incremental Lifetime Cancer Risk (unitless) for Indigenous Receptor exposed to Arsenic via soil ingestion in the Gordon Region during Baseline Case:	= 1.14924E-06

Result for Project-Alone Case:

$ILCR_{Ingestion}$	:	$ICLR_{Future\ Case} - ICLR_{Baseline\ Case}$	= 6.5E-08

Ecological Health

ECOLOGICAL RISK ASSESSMENT CALCULATIONS
RQ Worked Example

CALCULATION OF HEALTH RISKS FROM INGESTION OF SOIL

Health Risks to the Northern River Otter exposed to arsenic in soil (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Soil

$$ADD_{arsenic} = IF \times AF \times EPC_{arsenic}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from soil ingestion (mg/kg body weight/day)
IF	=	Intake factor (kg soil/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
$EPC_{arsenic}$	=	Exposure point concentration for arsenic in soil (mg/kg dw soil)

And:

$$IF = \frac{(IR \times f_{site})}{BW}$$

Where:

IR	=	Soil Ingestion Rate (kg dw/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	2.9E-04 kg dw/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	3.8E-05 kg soil/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	2.1E+00 mg/kg dw
$ADD_{arsenic}$	=	7.8E-05 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Soil

$$RQ_{soil} = \frac{ADD_{arsenic}}{TRV}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from soil ingestion (mg/kg body weight/day)
TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)

RQ_{soil}	=	Risk Quotient for soil ingestion (unitless)

Values:

$ADD_{ingestion}$	=	7.8E-05 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
RQ_{soil}	=	1.4E-04

CALCULATION OF HEALTH RISKS FROM INGESTION OF SMALL MAMMALS

Health Risks to the Northern River Otter exposed to arsenic in small mammals (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Small Mammals

$$ADD_{arsenic} = IF \times AF \times EPC_{arsenic}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from small mammal ingestion (mg/kg body weight/day)
IF	=	Intake factor (kg small mammal/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
$EPC_{arsenic}$	=	Exposure point concentration for arsenic in small mammals (mg/kg ww)

And:

$$IF = \frac{(IR \times f_{site})}{BW}$$

Where:

IR	=	Small Mammal Ingestion Rate (kg ww/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	4.5E-02 kg ww/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	6.*0E-03 kg small mammal/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	6.0E-02 mg/kg ww
$ADD_{arsenic}$	=	3.6E-04 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Small Mammals

$$RQ_{\text{small mammals}} = \frac{ADD_{\text{arsenic}}}{TRV}$$

Where:

ADD_{arsenic}	=	Average daily dose of arsenic from small mammal ingestion (mg/kg body weight/day)
TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)
$RQ_{\text{small mammal}}$	=	Risk Quotient for small mammal ingestion (unitless)

Values:

$ADD_{\text{ingestion}}$	=	3.6E-04 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
$RQ_{\text{small mammal}}$	=	6.4E-04

CALCULATION OF HEALTH RISKS FROM INGESTION OF WATER

Health Risks to the Northern River Otter exposed to arsenic in water (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Water

$$ADD_{\text{arsenic}} = IF \times AF \times EPC_{\text{arsenic}}$$

Where:

ADD_{arsenic}	=	Average daily dose of arsenic from water ingestion (mg/kg body weight/day)
IF	=	Intake factor (L water/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
EPC_{arsenic}	=	Exposure point concentration for arsenic in water (mg/L water)

And:

$$IF = \frac{(IR \times f_{\text{site}})}{BW}$$

Where:

IR	=	Water Ingestion Rate (L/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	6.1E-01 L/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	8.1E-02 L/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	6.0E-04 mg/L
$ADD_{arsenic}$	=	4.9E-05 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Water

$$RQ_{water} = \frac{ADD_{arsenic}}{TRV}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from water ingestion (mg/kg body weight/day)
TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)
RQ_{water}	=	Risk Quotient for water ingestion (unitless)

Values:

$ADD_{ingestion}$	=	4.9E-05 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
RQ_{water}	=	8.8E-05

CALCULATION OF HEALTH RISKS FROM INGESTION OF SEDIMENT

RQ Worked Example

Health Risks to the Northern River Otter Exposed to Arsenic in Sediment (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Sediment

$$ADD_{arsenic} = IF \times AF \times EPC_{arsenic}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from sediment ingestion (mg/kg body weight/day)
IF	=	Intake factor (kg sediment/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
$EPC_{arsenic}$	=	Exposure point concentration for in sediment (mg/kg dw)

And:

$$IF = \frac{(IR \times f_{site})}{BW}$$

Where:

IR	=	Sediment Ingestion Rate (kg dw/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	4.2E-03 kg dw/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	5.6E-04 kg sediment/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	2.9E+00 mg/kg dw
$ADD_{arsenic}$	=	1.6E-03 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Sediment

$$RQ_{sediment} = \frac{ADD_{arsenic}}{TRV}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from sediment ingestion (mg/kg body weight/day)
TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)
$RQ_{sediment}$	=	Risk Quotient for sediment ingestion (dimensionless)

Values:

$ADD_{ingestion}$	=	1.6E-03 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
$RQ_{sediment}$	=	3.0E-03

CALCULATION OF HEALTH RISKS FROM INGESTION OF BENTHIC INVERTEBRATE

RQ Worked Example

Health Risks to the River Otter Exposed to Arsenic in Benthic Invertebrate (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Benthic Invertebrate

$$ADD_{arsenic} = IF \times AF \times EPC_{arsenic}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from benthic invertebrate ingestion (mg/kg body weight/day)
IF	=	Intake factor (kg benthic invertebrate/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
$EPC_{arsenic}$	=	Exposure point concentration for in benthic invertebrate (mg/kg ww)

And:

$$IF = \frac{(IR \times f_{site})}{BW}$$

Where:

IR	=	Benthic invertebrate Ingestion Rate (kg ww/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	1.3E-01 kg ww/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	1.8E-02 kg benthic invertebrate/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	1.1E+00 mg/kg ww
$ADD_{arsenic}$	=	2.0E-02 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Benthic Invertebrate

$$RQ_{benthic\ invertebrates} = \frac{ADD_{arsenic}}{TRV}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from benthic invertebrate ingestion (mg/kg body weight/day)
TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)
$RQ_{benthic invertebrate}$	=	Risk Quotient for benthic invertebrate ingestion (dimensionless)

Values:

$ADD_{ingestion}$	=	2.0E-02 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
$RQ_{benthic\ invertebrate}$	=	3.7E-02

CALCULATION OF HEALTH RISKS FROM INGESTION OF FISH

RQ Worked Example

Health Risks to the Northern River Otter Exposed to Arsenic in Fish (Future Case - MacLellan region):

Calculation of Average Daily Dose from Ingestion of Fish

$$ADD_{arsenic} = IF \times AF \times EPC_{arsenic}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from fish ingestion (mg/kg body weight/day)
IF	=	Intake factor (kg fish/kg body weight/day) (see equation below)
AF	=	Absorption Factor for arsenic from the gastrointestinal tract (unitless)
$EPC_{arsenic}$	=	Exposure point concentration for in fish (mg/kg tissue)

And:

$$IF = \frac{(IR \times f_{site})}{BW}$$

Where:

IR	=	Fish Ingestion Rate (kg ww/day)
f_{site}	=	Fraction of time the Northern River Otter spends at the site
BW	=	Average body weight of the Northern River Otter (kg)

Values:

IR	=	7.1E-01 kg ww/day
f_{site}	=	100% (assumed to spend 100% of time at the site)
BW	=	7.5 kg
IF	=	9.5E-02 kg fish/kg body weight/day
AF	=	1 (assumed 100% absorption)
$EPC_{arsenic}$	=	1.1E-01mg/kg
$ADD_{arsenic}$	=	1.1E-02 mg/kg body weight/day

Calculation of Risk Quotient from Ingestion of Fish

$$RQ_{fish} = \frac{ADD_{arsenic}}{TRV}$$

Where:

$ADD_{arsenic}$	=	Average daily dose of arsenic from fish ingestion (mg/kg body

weight/day)

TRV	=	Oral Toxicity Reference Value (mg/kg body weight/day)
RQ_{fish}	=	Risk Quotient for fish ingestion (unitless)

Values:

$ADD_{ingestion}$	=	1.1E-02 mg/kg body weight/day
TRV	=	5.5E-01 mg/kg body weight/day
RQ_{fish}	=	1.9E-02

CALCULATION OF TOTAL HEALTH RISKS FROM ALL EXPOSURE PATHWAYS

RQ Worked Example

Total Health Risks to the Northern River Otter exposed to arsenic in surface soil, small mammals, surface water, freshwater sediment, freshwater benthic invertebrate, and freshwater fish (Future Case - MacLellan region):

$$RQ_{total} = RQ_{soil} + RQ_{small\ mammal} + RQ_{water} + RQ_{sediment} + RQ_{benthic\ invertebrate} + RQ_{fish}$$

Where:

RQ_{total}	=	Total Risk Quotient (unitless)
RQ_{soil}	=	Risk Quotient for soil ingestion (unitless)
$RQ_{small\ mammal}$	=	Risk Quotient for small mammal ingestion (unitless)
RQ_{water}	=	Risk Quotient for water ingestion (unitless)
$RQ_{sediment}$	=	Risk Quotient for sediment ingestion (unitless)
$RQ_{benthic\ invertebrate}$	=	Risk Quotient for benthic invertebrate ingestion (unitless)
RQ_{fish}	=	Risk Quotient for fish ingestion (unitless)
Values:	=	
RQ_{soil}	=	1.4E-04
$RQ_{small\ mammal}$	=	6.4E-04
RQ_{water}	=	8.8E-05
$RQ_{sediment}$	=	3.0E-03
$RQ_{benthic\ invertebrate}$	=	3.7E-02
RQ_{fish}	=	1.9E-02
RQ_{total}	=	6.0E-02

APPENDIX E.2
DERMAL RAF

Table 1. Relative Dermal Absorption Factors Used in the HHERA.

Chemical	Relative Dermal Absorption Factors (Unitless)[a]
Antimony	1.00E-02[b]
Arsenic	3.00E-02
Barium	1.00E-01
Beryllium	1.00E-02[b]
Cadmium	1.00E-02
Chromium	1.00E-01
Cobalt	1.00E-02[b]
Copper	6.00E-02
Lead	1.00E-02[b]
Manganese	1.00E-02[b]
Mercury	1.00E+00
Molybdenum	1.00E-02
Nickel	9.10E-02
Selenium	1.00E-02
Silver	1.00E-02[b]
Strontium	1.00E-02[b]
Thallium	1.00E-02[b]
Uranium	1.00E-01
Vanadium	1.00E-02[b]
Zinc	1.00E-01

NOTES:

[a] Relative Dermal Absorption Factors obtained from Health Canada (2010): Federal Contaminated Sites Risk Assessment in Canada, Part II: Health Canada Toxicological Reference Values (TRV) and Chemical-Specific Factors, Version 2.0. Available at: http://publications.gc.ca/collections/collection_2012/sc-hc/H128-1-11-638-eng.pdf

[b] Default value of 1% or 0.01 used as Relative Dermal Absorption Factor for chemicals for which no values have been calculated. Refer to Section 3.3, Health Canada (2010) and Section 2.6.2.1, MOE 2011 (Ontario Ministry of the Environment. Rationale for the Development of Soil and Groundwater Standards for Use at Contaminated Sites in Ontario. April 15, 2011)

APPENDIX E.3
UPTAKE FACTORS

Soil to Plant Uptake Factors (Gordon Region - Baseline Case)

COPC	Soil Conc. (mg/kg)	UP_{SP} Uptake Factor: Soil to Plant (mg/kg-dry plant / mg/kg-dry soil)	Reference	Soil to Plant Bioavailability Factor (Unitless)[b]	Plant Metabolic Factor (Unitless)[b]	Terrestrial Plant Dry Weight to Wet Weight Conversion Factor	Soil to Plant Uptake Factor (mg/kg-wet plant / mg/kg-dry soil)
Antimony	1.2E-01	3.9E-02 [a]	US EPA (2007)	1.0E+00	1.0E+00	0.15	5.9E-03
Arsenic	1.1E+00	3.8E-02	Bechtel Jacobs (1998), in US EPA (2007)	1.0E+00	1.0E+00	0.15	5.6E-03
Barium	4.9E+01	1.6E-01	US EPA Eco-SSL (2005a)	1.0E+00	1.0E+00	0.15	2.3E-02
Beryllium	3.0E-01	8.1E-01 [a]	US EPA (2007)	1.0E+00	1.0E+00	0.15	1.2E-01
Cadmium	3.6E-01	9.9E-01 [a]	Bechtel Jacobs (1998)	1.0E+00	1.0E+00	0.15	1.5E-01
Chromium (Total)	7.7E+00	4.1E-02	Bechtel Jacobs (1998), in US EPA Eco-SSL (2007)	1.0E+00	1.0E+00	0.15	6.2E-03
Cobalt	3.1E+00	7.5E-03	Bechtel Jacobs (1998), in US EPA (2005a)	1.0E+00	1.0E+00	0.15	1.1E-03
Copper	3.8E+01	2.2E-01 [a]	Bechtel Jacobs (1998)	1.0E+00	1.0E+00	0.15	3.2E-02
Lead	8.2E+00	1.1E-01 [a]	Bechtel Jacobs (1998), in US EPA (2007)	1.0E+00	1.0E+00	0.15	1.6E-02
Manganese	8.0E+01	7.9E-02	US EPA Eco-SSL (2007)	1.0E+00	1.0E+00	0.15	1.2E-02
